Mater Mothers’ Hospital GP
Maternity Shared Care Guideline
August 2013
Acknowledgments

Mater Mothers’ Hospital (MMH), Mater Health Services, Brisbane, is working with Greater Metro South Brisbane Medicare Local (GMSBML) and other key clinicians in the public and private sector, to develop a best practice model for GP (General Practitioner) Maternity Shared Care in South Brisbane, Queensland. Inclusive in this model is a uniform guidelines and protocols booklet for GPs and hospitals to assist them to care for women in accordance with current evidence based antenatal practice.

Sincere thanks are extended to the following for their dedication to the task:

- Dr Don Cave, Director Perinatal Medicine and Women’s Health Services MMH 2005-2013
- Dr Paul Devenish-Meares Chief Medical Information Officer MMH
- Dr Wendy Burton, GP Advisor, GMSBML
- Professor Claire Jackson, Professor of General Practice and Primary Health Care and Head of Discipline, Discipline of General Practice, University of Queensland
- Caroline Nicholson, Director, Mater/UQ Centre for Primary Health Care Innovation
- Sam Drew, Midwifery Unit Manager Ambulatory Services
- Kay Wilson, Deputy Director Ambulatory and Birthing Services
- Maree Reynolds, Director Women’s Health services
- Dr Glenn Gardener, Director of Maternal Fetal Medicine, MMH
- Dr Dianne Poad, Staff Specialist Obstetrics & Gynaecology, MMH
- Michelle Kelly, Manager, Parent Education & Support, MMH
- Annette Parry, CNC—Diabetes, MMH

The **MMH/GP Maternity Shared Care Program** is managed by:

Department of Obstetrics
Mater Mothers’ Hospital
South Brisbane, Qld 4101

1. Maternity Shared Care

Women wishing to attend the Mater Mothers’ Public Hospital (MMH) for their care during pregnancy and in childbirth have an option of GP shared care, which means most of their maternity care is managed by their General Practitioner (GP).

The most important principle underlying shared care is that the designation of high and low risk is a continuing process throughout the pregnancy, as more than one fifth of those designated as low risk on first antenatal visit will have their risk status changed during the course of their pregnancy. A further percentage will have their risk status changed during labour. In certain circumstances a high risk woman may be accepted into a shared care program providing all health care providers are familiar with the stated risk factors and consequent management strategies. This would require close collaboration between GPs and the hospital. It is most important in all cases to demonstrate consistency in the approach between all caregivers and the pregnant woman.

The decision to enter into a shared care arrangement is a joint decision made by the woman, her GP and the consultant obstetrician at the MMH, all of whom share responsibility. While it is not necessary that the GP wishing to conduct shared care holds the DRANZCOG (Diploma of the Royal Australian College of Obstetricians and Gynaecologists), he/she should have adequate knowledge and skill in obstetric care and be familiar with the policies of the MMH. GPs undertaking maternity shared care are expected to meet the alignment requirements for maternity shared care.

Shared care automatically implies that the responsibility for the health of the woman and her baby is shared.

A referral to a consultant obstetrician at Mater Mothers’ Hospital should be submitted before 12 weeks gestation whenever possible.

The following guidelines and protocols are to help you as a GP undertaking shared care, and the staff at the MMH, to care for women in accordance with current evidence based obstetric practice.

2. The Pregnancy Health Record

The aim of the Pregnancy Health Record is to facilitate women’s participation in their care and communication, and to promote early and appropriate use of antenatal services, particularly amongst disadvantaged groups. The Pregnancy Health Record must be used for all women involved in GP Shared Maternity Care.

The Pregnancy Health Record includes:

- An antenatal pathway format and will act as a prompt to both general practitioners and hospital professionals about the important issues to be covered at significant points in the pregnancy.
- Action oriented problems are designed to clearly identify concerns that may lead to an action above and beyond routine antenatal care e.g. past history of premature labour—admit if any contractions; APH repeated unexplained—serial growth measurements.
- A section entitled notes beneath each visit is designed to record concerns not necessarily requiring further action later in the pregnancy. This is a very important area for all members of the team to become aware of the individual woman’s experience of pregnancy.
- All care providers must record tests requested and the results when these are available. This process will enable rapid appreciation of timing and results of pathology tests ordered throughout the pregnancy. In addition this ensures that someone has checked the results of tests.

The Pregnancy Health Record is to be the substantive record of the woman’s pregnancy and MUST be completed at each visit. Information is to be recorded in the Pregnancy Health Record at every visit by the care provider and must be sufficient to meet the care provider’s duty of care in diagnostic and treatment decisions.
All original pathology and ultrasound results are to be included in the Pregnancy Health Record.

The Pregnancy Health record will be commenced by the midwife at the antenatal history appointment and given to the woman at the first appointment with the Obstetrician/Obstetric Registrar. This should be carried by her to all appointments during her pregnancy, including those with other health professionals. The woman should be made aware that the Pregnancy Health Record is the **ONLY** complete medical record maintained for her antenatal care and becomes part of the obstetric hospital’s medical records.

As the substantive record, the Pregnancy Health Record will be filed in the medical records at the MMH. The Pregnancy Health Record is not to be destroyed under any circumstances.

### 3. Medical indemnity recommendations

The risk of litigation in the practice of obstetrics mainly relates to the conduct of labour.

Recently litigation has also occurred when antenatal screening tests have failed to be performed, or when serious medical problems or obstetric complications have not been detected during the pregnancy, or there has been a delay in management.

**To be indemnified for the practice of maternity shared care the following guidelines must be adhered to:**

1. Every GP should check with their MDO or professional indemnity provider as to the extent of cover provided. However in general terms it is the Mater’s understanding that GPs with non-procedural cover are covered for claims arising out of ante-natal care (including any major antenatal complications) up until labour but are not covered for any intra-partum care or treatment. To be covered for intra-partum care the GP must have GP obstetric cover.

2. Ensure all appropriate antenatal screening tests are performed and followed up:
   a. any investigations requested by shared care GPs for any pregnant woman under his/her care must be followed up by the GP concerned;
   b. while part of appropriate follow up may be by communicating to the obstetrician/registrar at the shared care hospital the relevant results, it is still necessary for the GP to check that appropriate action has been taken. The GP will not be relieved of all liability by simply communicating the results in the assumption the hospital will act on the results.

3. Ideally the woman should be referred to antenatal clinic before 12 weeks and triaged for consultation with an obstetrician/obstetric registrar at an appropriate time;
   a. if shared care is planned then the consultant obstetrician/obstetric registrar or midwife should see the woman at 36 weeks and again at 41 weeks, provided that the antenatal course is uneventful. Should any problems occur before 36 weeks, or between 37 and 41 weeks, the consultant obstetrician should be advised;
   b. GPs may continue to see pregnant women for antenatal visits or for intercurrent medical problems, but in shared care the responsibility for the obstetric care and the delivery of the baby must rest with the consultant obstetrician or with a GP who has obstetric insurance arrangements.

4. In an emergency situation, e.g. haemorrhage or pre-term birth, any doctor irrespective of their cover must render whatever emergency assistance they can, and will be indemnified.

5. If an aligned GP is going to be away from his or her practice, then the woman’s care must be handed over to another aligned GP, or she must be referred back to MMH. It is not acceptable for GPs not in the shared care alignment program to provide back up.

6. Further details can be obtained from your indemnifier.
4. Alignment and CPD requirements

GPs that choose to join the Alignment Program will have access to:

- High quality educational events, including on-line education.
- A range of on-line resources and tools, including the Appointments Schedule, Guidelines for Referral and Consultation and referral templates.
- Improved lines of communication into the MMH.

In return, GPs participating in the Alignment Program will commit to providing:

- Referrals with an agreed minimum amount of clinically relevant information to facilitate safe provision of care. Hard-copy or electronic templates have been created for GP use. Referrals are to include copies of pathology and radiology reports.
- **MMH Ante-natal clinic (ANC) to be copied in all pathology and radiology requests.**
- Timely, clinically significant communication with the appropriate clinician/s.
- Attendance at education updates, with a minimum of one update per QI & CPD triennium.
- High quality care to their patients, as described in the RACGP JCC Obstetrics document at http://www.racgp.org.au/Content/NavigatonMenu/About/Governance/JointConsultativeCommittees/ObstetricsJCCO/20030812/jccsharedcare.pdf

The MMH is committed to supporting all GPs who wish to share care in maintaining their skills and familiarity with new protocols and approaches. The alignment program is designed to be as flexible as possible for busy GPs and to minimise time lost and risks inherent in delayed communication with the hospital, bookings and missing information.

To become an aligned Maternity Shared Care GP with the MMH, a GP must fulfil the requirements listed below.

**Alignment**

GPs must be a registered medical practitioner with current medical indemnity insurance.

As previously stated on page four, while it is not necessary that the GP wishing to conduct shared care holds the DRANZCOG, he/she should have adequate knowledge and skill in maternity care. GPs undertaking maternity shared care are expected to meet the alignment requirements for maternity shared care and be familiar with the policies of the MMH.

To be able to practice maternity shared care with MMH GPs must have attended one Maternity Shared care alignment seminar per triennium and completed the associated knowledge questionnaire satisfactorily.

**To maintain alignment**

The GP must either:

1. Repeat the standard Alignment Seminar OR attend the Advanced Alignment Seminar including Q&A; OR
2. Attend three relevant antenatal or postnatal/neonatal CPD events AND complete online education including Q&A.
   
   The online component is currently under development.

The three year cycle is run in parallel with the triennium set down by the RACGP and the Australian College of Rural and Remote Medicine (ACRRM) for GP Vocational Registration.
If the recommended best practice protocols are not followed and patient management problems occur accreditation may be withdrawn. This is monitored by reviewing patient records. GPs that have not been following protocols will be contacted, either by phone or letter to inform them of their protocol omission. Repeated omissions or serious management problems will be reviewed by the Maternity Shared Care Advisory Committee and may result in withdrawal of Alignment.

If alignment is not maintained a GP’s name will be removed from the GP Maternity Shared Care Program database, which would preclude participation in MMH Maternity Shared Care.

5. Contraindications to Shared Care
Special arrangements can be made for shared care for most women, but it is not recommended for women with the conditions listed under Section 6. However, some GPs may have skills that enable them to manage women with some of these conditions. Discussion with a consultant obstetrician is recommended to clarify management in these situations.

In circumstances where a woman has one of the listed complications and requests shared care, please make this clear in your referral letter to the consultant obstetrician involved.

The basic philosophy in this approach is that these women may have ongoing or future health needs for which the GP is responsible. It may not necessarily be appropriate to interrupt that process in pregnancy and in some circumstances it may be better to establish a modified system of shared maternity care between the GP and the consultant obstetrician.

6. Relative contraindications to Shared Care

Introduction
The Mater Mothers’ Hospital Guidelines for Consultation and Referral is designed to help GPs provide the best possible care for women during pregnancy. As the primary carer, you will be the first port of call for women seeking advice and/or treatment for a variety of health conditions.

This guide will help you decide the best course of action, depending on the severity of a woman’s health condition. Should a condition be identified that is not included in this booklet, a consultation with a specialist obstetrician should occur. The Guidelines for Consultation and Referral (available on-line at www.materonline.org.au/sharedcare) are underpinned by:

i. Principles of Clinical Governance
iii. Scope of Practice (QNC, 2001).

Each of the health concerns listed in this guideline have a recommended course of action that will be categorised by the letter A, B and/or C, further explained below.

A Discuss

• The GP will provide clinical care and, if necessary, call upon a qualified health professional as may reasonably be expected to have the necessary skills and experience to assist them in the provision of care.
• The GP will recommend to the woman that consultation with a suitably qualified health professional is warranted, if her pregnancy, labour, birth or postnatal period (or the baby) may be affected by a suspected or recognised condition.
• It is the GPs’ responsibility to initiate a discussion with, or provide information to another practitioner, with whom the care is shared, in order to plan and provide care appropriately.
• Where a consultation occurs, the decision regarding ongoing clinical roles/responsibilities should involve communication between all carers including the specialist obstetrician, the GP and the woman concerned.
This should include discussion of the need for and timing of any further review.

- The specialist obstetrician/health care professional will not routinely assume responsibility for ongoing care; they will work collaboratively with the GP to safely meet the wishes of the individual woman.
- Areas of discussion and involvement must be clearly agreed upon and clearly documented.

B Consult

- Consult with a MMH specialist obstetrician
- A consultation refers to the situation where a GP recommends the woman consult a specialist obstetrician or where the woman requests another opinion.
- The individual situation of the pregnant woman is evaluated and agreements are made about the responsibility for maternity care based on the Guidelines.
- It is the GP’s responsibility to initiate a consultation and to clearly communicate to the specialist obstetrician that they are seeking a consultation.
- The consultation involves addressing the issue that led to the referral, a ‘face to face’ assessment, and the prompt communication of the findings and recommendations to the woman and the referring professional.
- Where a consultation occurs, the decision regarding ongoing clinical roles/responsibilities should involve communication between all carers including the specialist obstetrician, the GP and the woman concerned. This should include discussion on any need for, and timing of, any further obstetric review.
- The specialist obstetrician will not routinely assume responsibility for ongoing care, depending on the situation; they will work collaboratively with the GP to safely meet the wishes of the individual woman.
- After consultation with a specialist obstetrician, it should be clear whether primary care and responsibility continues with the GP or is transferred to the specialist obstetrician.
- The specialist obstetrician may be involved in, and responsible for, a discrete area of the woman’s care, with the GP maintaining overall responsibility within their scope of practice.
- Where urgency, distance or climatic conditions make a ‘face to face’ consultation between a woman and a specialist obstetrician impossible, the GP must seek advice from the specialist obstetrician by phone. The GP should document this request for advice in their records and the Pregnancy Health Record, and discuss with the woman the advice received.
- Areas of discussion and involvement must be clearly agreed upon and clearly documented.

C Transfer

- Transfer responsibility for the women’s care to a MMH specialist obstetrician.
- When primary care is transferred, permanently or temporarily, from the GP to a specialist obstetrician, the specialist obstetrician assumes full responsibility for subsequent decision-making or for that period of care if temporary, in consultation with the woman.
- Areas of discussion and involvement must be agreed upon and clearly documented.
Indications at booking history

The following are specific indications for discussion, consultation and/or transfer of care when first discussing a woman’s needs during a booking visit. The main purpose of the indication list is to provide a guide for risk-selection.

1. Medical conditions

The Mater Mothers’ Hospital Guidelines for Consultation and Referral have been adapted from standards/practice guidelines.123

#### 7. Booking at the MMH

MMH is a private hospital contracted by Qld Health to conduct an agreed number of public births per year. Due to high demand it is not currently possible to accept routine low risk referrals from outside the catchment area. Special consideration is made for women requiring tertiary care and indigenous women.

The GP should submit a referral on the Mater Antenatal referral form as soon as possible following the first appointment, or if the LNMP is uncertain, after confirmation of the due date by dating scan. The Mater Antenatal referral form can be accessed by:

1. Users of Medical Director, Best Practice, Practix or Genie can download the referral templates from www.materonline.org.au from heading Services choose Maternity. There are instructions provided to load this referral template to your system on the site. Many of the required data fields on the referral form will be auto-completed from your management system.
2. From the website www.materonline.org.au the form can be printed out (as a PDF) and completed by hand and then faxed or mailed, or completed using the interactive PDF document and then printed out and faxed or mailed.

---

3. A supply of paper copies of the referral form is available for those practices without computer or Internet access. Copies of this form can be obtained by contacting the GP Liaison Midwife on 07 3163 1861; by email GPL@mater.org.au

Completed referrals may be faxed to 07 3163 8053 or posted to Mater Mothers’ Antenatal Clinic, Raymond Terrace South Brisbane Qld 4101.

Referrals are triaged daily and appointments are allocated according to urgency and due date.

A booking history appointment with a midwife will be arranged for 12-14 weeks and an obstetric appointment for 16-20 weeks unless a medical condition or obstetric history dictate an earlier appointment.

Women who want counselling re diagnostic testing (CVS or amniocentesis) should be referred to antenatal clinic.

Ultrasound reports and a copy of blood test results should be brought to the first antenatal clinic appointment.

8. Screening for fetal chromosome abnormalities e.g. Down Syndrome

Screening for fetal chromosome abnormalities should be discussed and offered to women of ALL ages:

- Screening tests for fetal chromosome abnormalities are dependant upon accurate gestational age dating—if dates are uncertain a ‘dating scan’ is required for appropriate screening tests to proceed.
- First trimester combined screen consisting of Papp-A, B-HCG and Nuchal translucency ultrasound.
- Alternative test in second trimester is the ‘triple test’ consisting of B-HCG, AFP and Oestradiol (*note for optimal triple test screen a dating scan is required).
- Biochemical tests in first and second trimester are available at all pathology providers and the timing of tests is outlined in the table below.
- When requesting a nuchal translucency scan, please indicate the pathology provider on the scan referral so that a combined result can be calculated on the day of the scan.

<table>
<thead>
<tr>
<th>Screening Test</th>
<th>Appropriate timing—gestational age</th>
</tr>
</thead>
<tbody>
<tr>
<td>First trimester biochemistry—Papp-A, B-HCG</td>
<td>10+0 to 13+6 weeks</td>
</tr>
<tr>
<td>Nuchal translucency scan</td>
<td>11+0 to 13+6 weeks</td>
</tr>
<tr>
<td>Second trimester Triple test—B-HCG, AFP, oestradiol</td>
<td>15 to 20 weeks (optimal time 16 weeks)</td>
</tr>
</tbody>
</table>

When ordering the first trimester combined screen, the blood test should be performed before the nuchal translucency scan so that the result is available to be combined into a single adjusted risk on the day of the scan. The result should not be given with separate biochemistry and nuchal translucency risks but always as a ‘combined’ adjusted risk only. If the gestational age is altered by the scan by more than four days the biochemistry report should be altered by contacting the relevant pathology provider.

**Routine morphology ultrasound screening**

All pregnant women should be offered a morphology ultrasound scan performed between 18+0 and 20+6 weeks gestation. The routine morphology scan is not endorsed as a screening test for Down syndrome and if screening for Down syndrome is requested by the woman then the only endorsed screening test for Down syndrome at this gestation is the triple test (see above).
9. Maternity Shared Care visit schedule

*BP, oedema, fetal growth measurement—fundus to symphysis pubis from 24 weeks, fetal movement, fetal heart rate, presentation/position (from 3rd trimester), reassess identified risks e.g. smoking, alcohol, depression.*
Reinforce aspects of health promotion and parent education.

Reassess planned schedule of care and identify women who need additional care.

Document in pregnancy health record.

### At 28 weeks

**Appointment with GP**

- Routine antenatal assessment as above and assessment of fetal growth and well being.*
- Reinforce aspects of health promotion and parent education.
- Obtain blood for FBC. If Hb less than 100 for further investigation and appropriate treatment.
- If Rh(D) negative, take antibody screen before offering administration of 625 IU Anti-D immunoglobulin IM.
- Gestational diabetes screening offered to all women. Fasting 75 g 2 hour oral glucose tolerance test.
- Discuss infant feeding (written information has been provided at booking).
- Discuss Vitamin K and Hep B vaccination (written information has been provided at booking visit).
- Reassess planned schedule of care and identify women who need additional care—See MMH Guidelines for consultation and referral.
- Discuss and commence birth plan.
- Consider discharge planning.
- Document in pregnancy health record.

### At 31 weeks

Primigravida and Multigravida with a different partner this pregnancy (if no risk factors needing review).

**Appointment with GP**

- Routine antenatal assessment.*
- Review, discuss and document results of tests taken at 28 weeks and action as required.
- Reassess planned schedule of care and identify women who need additional care. See MMH Guidelines for consultation and referral.
- Discuss neonatal Vitamin K and Hep B vaccination. Obtain verbal consent and written consent if form available.
- Document in pregnancy health record.

### At 34 weeks

**Appointment with GP**

- Routine antenatal assessment.*
- Order FBC for 36 week appointment
- If Rh(D) negative, recommend and administer 625 IU Anti-D immunoglobulin IM.
- For women not seen at 31 weeks, review as above.
- Repeat ultrasound scan if low lying placenta at morphology scan.
- Reassess planned schedule of care and identify women who need additional care as per MMH Guidelines for consultation and referral.
- Discuss birth plan.
- Document in pregnancy health record.
- Computerised GPs to print antenatal record summary and attach into hand held record for MMH.

Use the EPDS to assess antenatal depression

---

*BP, oedema, fetal growth measurement—fundus to symphysis pubis from 24 weeks, fetal movement, fetal heart rate, presentation/position (from 3rd trimester), reassess identified risks e.g. smoking, alcohol, depression.

### 10. MMH Antenatal support

#### 10.1 Depression

**The recognition of depression in the antenatal period is important** as it may require treatment during the pregnancy and is a strong predictor for post partum depression. It is appropriate to use the Edinburgh Postnatal Depression Scale to assess antenatal depression (see Section 16.2). This does occur at the first midwifery visit and is to be repeated by the GP routinely at 34 weeks and 6 weeks post partum or if there are any ongoing concerns. It is the GP's responsibility to arrange appropriate referrals if needed and document in pregnancy health record.

#### 10.2 Early Pregnancy Assessment Unit

The Early Pregnancy Assessment Unit (EPAU) is a specialist unit located on level 7 in the Mater Mothers’ Hospital for care of women with molar pregnancy, stable (painfree) ectopic pregnancy and threatened or confirmed miscarriage. Women with hyperemesis should be referred to the adult emergency department.

To refer a woman to EPAU, please call 07 3163 5132 or fax 07 3163 6120. EPAU is open from 8.30 am to 2.30 pm Monday to Friday by appointment only. A referral from a GP is not essential. The EPAU Team consists of a nurse, a medical practitioner and a sonographer. A triage system will be used to offer the correct clinical pathway for women with bleeding and/or pain in early pregnancy.

**Service criteria:**

**The inclusion criteria are:**

- A pregnancy of less than 20 weeks gestation.
- Pain or vaginal bleeding but clinically stable.
- No bleeding but with a nonviable pregnancy.
- A confirmed stable ectopic pregnancy to be treated conservatively.
- Pregnancy of unknown location, stable and requiring follow-up.

---

* BP, oedema, fetal growth measurement—fundus to symphysis pubis from 24 weeks, fetal movement, fetal heart rate, presentation/position (from 3rd trimester), reassess identified risks e.g. smoking, alcohol, depression.
Exclusion criteria are:

- More than 20 weeks completed gestation.
- Haemodynamically unstable/heavy bleeding (takes less than 30 mins to soak a pad).
- In pain that exceeds normal period pain and/or is unrelieved by simple analgesia.
- Pulse rate > 100, any postural drop.
- For routine pregnancy confirmation.
- For routine pregnancy dating scan.
- Nausea and vomiting in pregnancy.
- Presenting with other acute gynaecological conditions or other medical/surgical conditions in early pregnancy.
- Advance notice required if interpreter needed as it is preferable to use an on-site interpreter.

Women should be given the option of attending emergency department to be triaged or EPAU for the first available appointment. If women choose EPAU, they must be advised to attend sooner than the given appointment should the bleeding/pain increase (< 30 mins to soak a pad and pain not relieved by simple analgesia).

**Contact details:**
If you have any queries, please contact the EPAU nurse co-ordinator on 07 3163 5132.

**10.3 Pregnancy Assessment and Observation Unit**

The Pregnancy Assessment and Observation Unit (PAOU) is open 24 Hours, 7 days. Self referral or GP referral. Women from 20 weeks of pregnancy with conditions requiring immediate assessment e.g. reduced fetal movements, hypertension, ruptured membranes, contractions, bleeding etc. Please call prior to presentation.

Phone: 07 3163 6577  Fax: 07 3163 2281. For clinical consultation or advice phone the obstetric registrar 07 31636611. Patients call 07 3163 7000

**11. Supplements**

**VITAMIN AND MINERAL SUPPLEMENTS:** see RANZCOG College Statement C-Obs 25

**IODINE:**

**FOLATE:**

The National Health and Medical Research Council (NHMRC)
12. How to Manage Abnormal Results

Any investigations requested by a GP for any pregnant woman under his/her care must be followed up by the GP concerned. It is the GPs responsibility to follow up all abnormal results irrespective of whether a copy has been sent to the hospital.

**Complete blood picture**
Consider iron studies if the haemoglobin is 100g/L or less and the MCV is low or red blood cells are microcytic. Check B12/folate levels if the red blood cells are macrocytic.

Testing for thalassaemia (haemoglobin electrophoresis) should also be considered where appropriate. Low white cell or platelet counts should prompt discussion with obstetric registrar, and/or referral to MMH Antenatal Clinic.

**Blood group and antibody screen**
Any positive test for antibody levels should prompt immediate referral to MMH Antenatal Clinic.

**Rubella titre**
A “non immune” level should prompt a note to discuss immunisation with the woman postnatally. Under no circumstances should immunisation be given in pregnancy. Contact with young children with rubella should be avoided.

**Syphilis serology**
A positive result should prompt referral to MMH Antenatal Clinic.

**Hepatitis B and C, and HIV tests**
A positive result should prompt immediate referral to Mater Mothers Antenatal Clinic. The obstetrician will refer to Mater Adults infectious diseases.

**Maternal serum screening**
Abnormal maternal serum screening results must be referred urgently to the participating hospital for counselling with a view to offering CVS or Amniocentesis.

**Morphology ultrasound**
Any abnormality should prompt discussion with /referral to Mater Mothers Antenatal Clinic. Fax scan report and previous results eg. nuchal translucency and a cover letter to antenatal clinic Fax 3163 8053. For consultation or advice phone the obstetric registrar on 3163 6611 or Maternal Fetal medicine staff only line 3163 1899.

**Oral glucose tolerance test**
An abnormal result is fasting $\geq 5.5$ mmol/L and/or at two hours $\geq 8.0$ mmol/L. The diagnosis of gestational diabetes should prompt immediate referral to the Antenatal Clinic and transfer from GP Shared Care to MMH Obstetric care. Please fax a referral letter and a copy of the GTT result to GP Liaison Midwife c/- ANC on fax 07 3163 8053 highlighting that this referral is for the management of gestational diabetes in a previously booked shared care woman. Please do not use the antenatal new patient referral form if patient is already booked.

---

13. How to Manage Abnormal Findings/Symptoms

**Intrauterine growth restriction (IUGR)**

Measure symphysial-fundal height (SFH):

- Ensure mother is comfortable in a semi-recumbent position, with empty bladder.
- Use the unmarked side of a non-elastic tape measure.
- Measure from fundus to top of symphysis pubis.
- Measure longitudinal axis of the uterus, do not correct to midline.
- Record and plot metric measurement on chart.
- Emphasis on slope of serial measurements.

Other considerations include transverse lie, multiple pregnancies and obesity.

If serial SFH measurements are flattening then refer the woman for an ultrasound and request:

- fetal size/growth compared with previous ultrasound (BPD, abdominal circumference);
- doppler of umbilical artery flow;
- amniotic fluid index (ask for normal range).

If any parameters are abnormal refer to MMH by communicating with the PAOU obstetric registrar on 07 3163 6611.

**Reduced fetal movements**

If fetal movements are reduced check fundal height and fetal heart rate and refer to Mater Mothers PAOU for assessment of fetal wellbeing.

If the fetal movements are appropriate but GP or woman is uncomfortable about the situation, or there is a previous history of fetal death in utero, or a stillbirth, refer to PAOU by communication with the PAOU obstetric registrar on 07 3163 6611.
Hypertension

Definition: systolic blood pressure greater than or equal to 140 mmHg and/or diastolic blood pressure greater than or equal to 90 mmHg (Korotkoff V).1

Essential hypertension is diagnosed prior to pregnancy or before 20 weeks. Gestational hypertension is diagnosed after 20 weeks (without pre-existing hypertension).

Pre-eclampsia is a multi-system disorder unique to human pregnancy characterised by hypertension and involvement of one or more other organ systems and/or the fetus. Raised blood pressure is commonly but not always the first manifestation. Proteinuria is the most commonly recognised additional feature after hypertension but should not be considered mandatory to make the clinical diagnosis.1

A diagnosis of preeclampsia can be made when hypertension arises after 20 weeks gestation and is accompanied by one or more of the following:

- Renal involvement:
  - Significant proteinuria—dipstick proteinuria confirmed by urine protein/creatinine ratio ≥ 30mg/mmol. In view of the close correlation between spot urine protein/creatinine ratio and 24 hour urine excretion, the latter is rarely required (21).
  - Serum or plasma creatinine > 90 µmol/L
  - Oliguria
- Hematological involvement
  - Thrombocytopenia
  - Hemolysis
  - Disseminated intravascular coagulation
- Liver involvement
  - Raised serum transaminases
  - Severe epigastric or right upper quadrant pain.
- Neurological involvement
  - Convulsions (eclampsia)
  - Hypereflexia with sustained clonus
  - Severe headache
  - Persistent visual disturbances (photopsia, scotomata, cortical blindness, retinal vasospasm)
  - Stroke
- Pulmonary edema
- Fetal growth restriction
- Placental abruption

Management of hypertension

- if BP is elevated, review within a few days;
- if persistent perform the following tests: dipstick urinalysis and urine protein/creatinine ratio. Full blood count, U/E,ELFTs cc results to MMH;
- Educate patient re signs/symptoms of pre-eclampsia (as stated above);
- if persistent elevation of BP or any suggestion of pre-eclampsia or IUGR refer to Mater Mothers PAOU by communicating with the obstetric registrar on 07 3163 6611.

Vaginal bleeding > 20 weeks (See EPAU advice for bleeding < 20 weeks)

- Perform a physical assessment of the woman and record a fetal heart rate
- Review ultrasound result for placenta site (clear of os) and if no scan refer for one if stable (speculum can be performed with placenta praevia but avoid digital exam)
- Speculum to view cervix and PAP if no normal PAP result in last two years
- Consider need for Anti D if rhesus negative and kleihauer count to ascertain amount to give
- If spotting ceased and exam normal reassure and encourage observation at home
- For ongoing bleeding or anything other than light spotting refer woman to PAOU at MMH ext 07 3163 6577
- If heavy blood loss and or patient appears clinically compromised IV access, arrange urgent transfer to hospital and contact on call obstetric registrar/consultant.

Abnormal presentation

If 36 weeks or more and suspected breech or transverse lie refer to antenatal clinic for assessment as soon as possible. Fax a letter to 3163 8053 or phone for an appointment with an obstetric registrar.

14. Care for women who are Rh D negative

Pregnant women who are Rh D negative fall into two categories: those with and those without Anti-D antibodies.

Women with Rh D antibodies are not suitable for shared care.

The following information therefore relates only to women who are Rh D negative and have no preformed antibodies.

Testing for Anti-D antibodies:

- All women should be tested for blood group antibodies at the first antenatal visit.
- Women who are Rh negative and had no Rh D antibodies in early pregnancy should be tested again for the presence of antibodies before administration of Anti-D at K28.
- Ideally testing should precede administration of Anti-D. However, if both are done at the same clinic appointment, the sequence in which they occur does not matter. It takes some time (2-4 hours) before the Anti-D that has been injected can be detected in the circulation.
- Further testing later in pregnancy (after administration of Anti-D) is superfluous because the test cannot distinguish between endogenous and administered Anti-D.

Anticipating prophylactic Anti-D administration in pregnancy

- All women who are Rh D negative and have no preformed Anti-D antibodies should be informed about the need to prevent Rh D sensitisation. This includes:
  - Anti-D administration if a sensitising event occurs in pregnancy;
  - routine prophylaxis at 28 and 34 weeks gestation;
  - further prophylaxis after birth if the baby is Rh D positive.
- Recurrent vaginal bleeding requires discussion with/or referral to the MMH before administering doses of Anti-D.
- Informed consent for prophylaxis should be obtained early in pregnancy (as soon as the Rh D status has been determined). This is to cover any and all occasions on which Anti-D may become indicated during pregnancy.
- The woman’s consent for prophylaxis must be documented in her Pregnancy Health Record.

Notes in aid of obtaining informed consent

Ensure that the woman understands what Rh D sensitisation means and the consequences it may have, if not necessarily for this, at least for future pregnancies.
• Provide the woman with information.
• Antenatal administration of Anti-D to all Rh negative women is recommended by the NHMRC. Administration of Anti-D to all Rh negative women who give birth to a Rh positive baby has been practiced for many years in Australia.
• Anti-D is a blood product. As it is made from human blood, there is a theoretical risk of transmission of blood borne diseases. However, the risk of transmission is extremely small because of the careful selection of blood donors and because of the way in which Anti-D is produced from the blood.
• More than 1½ million doses of Anti-D have been given in Australia without a single viral transmission thus far.
• The risk of HIV transmission, for example, is currently estimated to be less than one in five million Anti-D ampoules administered. Thus far, HIV has never been transmitted through Anti-D injections.
• One case has been reported of transmission of Hepatitis C attributed to Anti-D administration. This occurred overseas.

**Anti-D prophylaxis for potentially sensitising events**

Potentially sensitising events are defined as any situation in which there is an increased likelihood of fetal red blood cells entering the maternal circulation. These include:

- any uterine bleeding in pregnancy ranging from (threatened) miscarriage to antepartum haemorrhage. However, there is insufficient evidence to suggest that a threatened miscarriage before K12 necessitates Anti-D
- any abdominal trauma in pregnancy
- any uterine or intra-uterine intervention (such as external cephalic version, amniocentesis, etc). However, the responsibility for prophylaxis rests with the hospital at which these interventions are performed.

If a sensitising event occurs:

- before 12 weeks gestation the recommended prophylaxis consists of 250 IU (international units) CSL Rh D immunoglobulin
- at or after 12 weeks gestation the recommended prophylaxis consists of 625 IU (international units) CSL Rh D immunoglobulin
- after routine prophylaxis at 28 weeks, she should have a dose of Anti-D regardless of when the prophylactic dose was administered.

**Routine prophylaxis at 28 and 34 weeks (with or without previous sensitising events)**

- Rh D negative women without preformed Anti-D antibodies should receive 625 IU CSL Rh D immunoglobulin at 28 weeks (after or simultaneously testing for preformed Rh D antibodies) and again at 34 weeks.
- Anti-D can be administered before the result of the test for endogenous Anti-D at 28 weeks becomes available provided that the woman had no Anti-D antibodies at the beginning of pregnancy.
- Basic principles about the timing of the routine prophylaxis are:
  1. the Anti-D administration will provide cover for a minimum of six weeks;
  2. the risk of sensitisation increases as pregnancy progresses.
- Thus, if someone has received Anti-D slightly before 28 weeks, the 34 weeks injection should still be given as planned at 34 weeks.
- If someone has missed out on receiving Anti-D at 28 weeks (for example because they did not attend) Anti-D should be given at the next visit (better late than never). In that case, the second injection should be planned six weeks later, provided that the woman is still pregnant then.
- If a woman has received Anti-D for a potentially sensitising event, e.g. antepartum haemorrhage or trauma, before 28 weeks, she should still receive Anti-D at 28 and 34 weeks as scheduled unless the Anti-D for the sensitising event was administered less than one week before the prophylactic dose being due.

1 RANZCOG COLLEGE STATEMENT FOR GUIDELINES for the use of RH(D) Immunoglobulin (Anti-D) in Obstetrics in Australia.
Administration of Anti-D

- Rh D immunoglobulin should be given slowly by deep intramuscular injection, using a 20 gauge needle.
- Administration of Anti-D must be documented in the woman’s Pregnancy Health Record.
- Shared care GPs can order Anti D from QML (delivered free as part of their routine courier service) or from the Blood Bank (courier or taxi fees apply) for routine administration at 28 and 34 weeks provided that the woman has given her consent to the prophylaxis.

Dosing recommendations for Rh D negative women—Australian Red Cross Blood Service (as at 10/1/06)

15. Birth and Postnatal Care

The care of the woman during labour and birth will be the responsibility of the health care team at the MMH. At discharge, a summary of the pregnancy and birth outcome will be sent to the GP. MMH has a Breastfeeding Support Service (Telephone: 07 3163 8200) for women experiencing feeding difficulties (refer to Section 15.1).

A postnatal appointment with the GP is advised for mother and baby at 5-10 days and 6 weeks. Some women may be offered a postnatal outpatient appointment at MMH if they have experienced specific problems during pregnancy or birth eg 3rd or 4th degree tear. This appointment will be made prior to discharge. During the postnatal period, the GP may identify problems that require referral back to the MMH or to a paediatrician.

Postnatal GP appointment at 5—10 days

Mother

Early contact to assess wellbeing, social risk factors, and level of support. Apply Edinburgh Postnatal Depression Scale if indicated. Review:

- BP
- lochia
- perineum
- abdominal wound if LSCS
- feeding—refer section 15.5 for breastfeeding information and advice
- contraception.

Referral (prn):

- Child Health Centre
- lactation consultant Mater breast feeding support service phone 3163 8200
- Australian Breastfeeding Association
- social worker.
Baby
Review by GP between five and ten days if baby discharged from hospital < 72 hours of age (Queensland Health, Personal Health Record book):
- age, weight, head circumference
- feeding
- examination: signs of jaundice; fontanelle/sutures; eyes and red reflexes; face/palate/ears; limbs; spine; genitalia; anus; meconium within 24h; urine output, abdomen and umbilicus; respiratory; cardiac (auscultation and femoral pulses; hips; neurological/reflexes
- health promotion safe sleeping, SIDS prevention, benefits of breast feeding, vaccinations, role of child health nurse.
Referral (prn):
- child health clinic
- paediatrician

Postnatal GP appointment at 6 weeks

Mother
Assess wellbeing, social risk factors, and level of support. Apply Edinburgh Postnatal Depression Scale.
Examination:
- BP
- breasts, nipples
- abdomen—palpate uterus unless LSCS, check wound if LSCS, refer to physio if abdominal diastasis
- examine perineum if tear or episiotomy. Pap smear if due; ask re urinary or faecal incontinence
- family planning / intercourse.
Follow-up for mother e.g. gestational diabetes, hypertension.

Baby
As for initial visit and including the following.
Examination:
- weight, length, head circumference—plot on growth charts
- vision profile—eyes tracking (red light reflex)
- facial symmetry—smiling
- hearing profile
- cardiovascular
- femoral pulses
- hip testing
- genitalia—testes fully descended?
- development.
Discuss:
- bowel habits, immunisation, SIDS awareness.
16. Further information for GPs

16.1 Infections

Pregnancy may be complicated by any of the common infections. There are however infections which can impact adversely on fetal well-being. Discussion with a consultant obstetrician is required where these infections are suspected or there is a history of exposure.

Obstetric Consultant  07 3163 6609     Obstetric Registrar  07 3163 6611

Infections include:

- **Coxsackie virus (hand, foot and mouth disease)**
  - In adults, most diseases caused by coxsackie B viruses are mild. However coxsackie B viruses may cause an inflammation in the fetal heart or lungs and increase the chance of spontaneous miscarriage, infection in the foetus or stillbirth. Referral for discussion of confirmed infection during pregnancy is appropriate.

- **Cytomegalovirus**
  - Primary infection and reactivation in pregnancy can both result in congenital CMV. Up to 20% of infants born to mothers who have primary infection in pregnancy will be symptomatic with mortality in this group of 9% and severe neurological sequelae in 80%.

- **Epstein-Barr virus (Glandular Fever)**—Primary EBV infection during pregnancy is rare. Only 3% to 3.4% of pregnant women are susceptible (Arvin and Maldonado 2001)
  - Only 50% of pregnant women infected will develop clinical infectious mononucleosis.
  - The low frequency of maternal EBV in pregnancy makes it difficult to assess the risk to the fetus.
  - Early studies have reported that infants occasionally suffer damage due to maternal primary EBV infection just before conception or during pregnancy.
  - In other studies, EBV infection was not transmitted to the fetus and there were no adverse effects.
  - The risk of intrauterine transmission of EBV infection is considered to be low, even when the mother is symptomatic clinically (Fleisher and Bolognese 1984; Sumaya 1998; Arvin and Maldonado 2001).

- **Genital herpes simplex (HSV)**
  - Risk of transmission relates to primary infection most significantly. 50% risk if primary infection with active lesions at time of vaginal birth. Recurrence risk of transmission around 3% if active lesions at time of vaginal birth.
  - If primary infection in second half third trimester refer for advice about delivery. Prophylactic acyclovir offered to reduce incidence of recurrence to facilitate decisions around vaginal delivery.

- **Hepatitis B**
  - Infection rate 90% and infection occurs typically at time of birth
  - neonatal vaccination protects 95% of at risk newborns
  - presence of HBeAg confers high risk fetal transmission
  - HBIG and HB vaccine for the baby at birth.

- **Hepatitis C**
  - Obstetrician will refer to infectious diseases consultant
  - screen for other STIs
  - check liver function
  - avoid invasive tests ( has implications for discussion around Nuchal Screening)
  - vaginal birth and breast feeding are not discouraged
  - baby is screened at 18 months for HCV antibody.
- HIV/AIDS
  - Risk of transmission during pregnancy and postnatal period 25%. This can be reduced to close to 1% with antiretrovirals and elective caesarean section for birth. More recent data suggests for women with a nondetectable viral load vaginal birth may not confer any increased risk.
  - screening for other STIs is important
  - avoid invasive tests (has implications for discussion around Nuchal Screening)
  - referral to infectious diseases physician appropriate
  - breastfeeding confers a risk of transmission and is not advised in Australia.

- Listeria
- Measles and measles contact
- Mycobacterium tuberculosis
- Parasitic diseases
- Parvovirus (slapped cheek syndrome)
  - Up to 50% pregnant women have pre-existing IgG and therefore not considered at risk of infection
  - B19 infection in pregnancy associated with fetal loss and hydrops fetalis
  - fetal hydrops is amenable to treatment with intrauterine transfusion after 20 weeks
  - check for maternal IGM and IGG. If IgG positive and IgM negative reassure and referral not required if IgG negative or IgM positive refer.

- Rubella infection
  - German measles outbreaks rare secondary to effective immunisation campaign in Australia
  - heterogenous spread fetal infection rates 80% first trimester, 25% second trimester, 35% early third trimester and 100% fetuses exposed after 36 weeks
  - risk congenital rubella limited to first 16 weeks of pregnancy
  - congenital rubella syndrome associated with sensorineural deafness, ophthalmic abnormalities, cardiac malformations, neurological sequelae
  - infection later in pregnancy associated with intrauterine growth restriction
  - diagnosis by four fold rise in IgG or the presence of IgM or positive rubella culture

- Toxoplasmosis
  - Mononucleosis like illness
  - infection confirmed if demonstrate seroconversion IgG or IgM negative to positive
  - avidity testing helps interpret results as IgM can remain positive for up to 13 months
  - risk of fetal transmission increases with increasing gestational age (15% first trimester, 44% second trimester, 71% 3RD trimester)
  - amniocentesis with PCR for T. gondii undertaken to diagnose fetal infection and enable optimal medical treatment or discussion about pregnancy continuance.

- Treponema Pallidum (Syphilis)
  - Perinatal transmission 50%in primary or secondary syphilis. Reduced risk for latent and tertiary disease
  - risk of intrauterine growth restriction, stillbirth, neonatal death, preterm birth, congenital infection, anomalies
  - adequate treatment of mother in pregnancy can reduce fetal infection rate from 70 to 100% down to 1%.

- Varicella-zoster (chicken pox)
  - At risk times before 20 weeks 2% risk of Varicella Zoster syndrome. Risk of maternal compromise eg. pneumonia. Acyclovir if seen within 24 hours of symptoms. Five or less days before birth high risk as baby develops infection without maternal antibodies. Refer any woman with varicella in pregnancy, but liaise by phone in first instance to reduce risk to other pregnant women.

16.2 Edinburgh Postnatal Depression Scale (EPDS)¹

**Instructions for users**
- The mother is asked to underline which comes closest to how she has been feeling in the previous seven days.
- All 10 items must be completed.
- Care should be taken to avoid the possibility of the mother discussing her answers with others.
- The mother should complete the scale herself unless she has limited English or has difficulty reading.

**How are you feeling?**
As you have recently had a baby, we would like to know how you are feeling now. Please underline the answer which comes closest to how you have felt in the past seven days, not just how you feel today.

Here is an example, already completed:

**I have felt happy**
Yes, most of the time
Yes, some of the time
No, not very often
No, not all

**In the past seven days**

1. I have been able to laugh and see the funny side of things:
   - As much as I always could
   - Not quite so much now
   - Definitely not so much now
   - Not at all

2. I have looked forward with enjoyment to things:
   - As much as I ever did
   - Rather less than I used to
   - Definitely not so much now
   - Hardly at all

3. I have blamed myself unnecessarily when things went wrong *
   - Yes most of the time
   - Yes, some of the time
   - Not very often
   - No, never

4. I have felt worried and anxious for no good reason:
   - No, not at all
   - Hardly ever
   - Yes sometimes
   - Yes, very often

5. I have felt scared or panicky for no good reason *
   - Yes, quite a lot
   - Yes, sometimes
   - No, not much
   - No, not at all

6. Things have been getting on top of me *
   - Yes, most of the time I haven’t been able to cope at all
   - Yes, sometimes I haven’t been coping as well as usual
   - No, most of the time I have coped quite well
   - No, I have been coping as well as ever

7. I have been so unhappy that I have had difficulty sleeping *
   - Yes, most of the time
   - Yes, sometimes
   - Not very often
   - No, not at all

8. I have felt sad or miserable *
   - Yes, most of the time
   - Yes, quite often
   - Not very often
   - No, not at all

---

9. I have been so unhappy that I have been crying *
Yes, most of the time
Yes quite often
Only occasionally
No, never

10. The thought of harming myself has occurred to me *
Yes, quite often
Sometimes
Hardly ever
Never

**Scoring**

Response categories: 0, 1, 2, and 3 according to increased severity of the symptom.

Items marked with an asterisk * are reverse scored (i.e. 3, 2, 1, 0). The total score is calculated by adding together the scores of each of the 10 items.

Mothers who score above 12 are likely to be suffering from a depressive illness of varying severity. The EPDS should not override clinical judgement. A careful clinical assessment should be carried out to confirm the diagnosis. The scale indicates how the mother has felt during the previous week and in doubtful cases, it may be usually repeated after two weeks. The scale will not detect mothers with anxiety neuroses, phobias or personality disorders.
Recommended oral glucose tolerance testing six–eight weeks postpartum to exclude diabetes. Recommended repeat oral glucose tolerance test prior to or early in next pregnancy, follow up of impaired fasting glucose by twice yearly checks for frank diabetes in addition to assessment of other risk factors of macrovascular disease.

Postnatal care

Recommended follow up oral glucose tolerance testing at least two yearly (possibly at time of the cervical screening) if previous glucose testing was positive.

16.5 Breastfeeding
Breastfeeding is the normal method of feeding infants and positively influences both their immediate and long-term health.

GPs have a very important role in encouraging and supporting women to breastfeed.

- The initial antenatal interview between a woman and her doctor or midwife should include a careful assessment of the woman’s (and her partner’s) attitudes, beliefs, expectations, knowledge and experience in relation to infant feeding.
- Women are more likely to breastfeed if: they are committed to breastfeeding prior to birth, their husband/partner and mother supports breastfeeding, they attend antenatal classes, and if they have access to support in the postnatal period.

Recommendations for breastfeeding

- Exclusive breastfeeding for the first six months
- Definition of exclusive breastfeeding: “The infant receives only breast milk by mouth, no other liquid or solids, with the exception of medication for the first six months of life
- Continued breastfeeding until 12 months of age, with introduction of solids around 6 months of age
- Breastfeeding continued beyond 12 months as desired by mother and child.

Benefits of breastfeeding

Mother

- Accelerated weight loss and return to pre-pregnancy body weight
- Protection against premenopausal breast cancer, ovarian cancer and osteoporosis
- Promotes a loving bond between mother and baby
- Convenient and inexpensive
- Prolonged period of post-partum infertility.

Infant

- Increased protection against bacteraemia, meningitis, urinary tract infection, otitis-media, and SIDS
- Possible reduced risk of developing obesity, coronary vascular disease, cancer, Type two diabetes, asthma and delayed onset of coeliac disease
- Reduced incidence and duration of diarrhoeal illnesses
- Improved cognitive development
- Reduced risk of developing cow’s milk allergy and allergy related illness
- Reduced malocclusion due to better jaw shape and development.

GPs have a very important role in supporting women to overcome any breastfeeding problems.

- Some women cease breastfeeding too early because they encounter problems, do not have support, or mistakenly feel they do not have an adequate supply of breast milk
- Timely support and management is the key to overcoming these problems to ensure continued breastfeeding
- Refer to services providing breastfeeding support (see end of section).

Common problems with breastfeeding and where to go for help:

- Is my baby getting enough milk?
- Is my baby feeding enough? Too frequently?
- Breastfeeding is painful—sore or cracked nipples
- engorgement or mastitis
- oral infant pathology i.e. tongue tie
- flat or inverted nipples
- my baby is unsettled, particularly in the early evening, does my baby have colic?

MMH Breastfeeding Support Centre: 07 3163 8200

16.6 Smoking during pregnancy
- Effective smoking cessation intervention should be offered to pregnant smokers at the first antenatal visit and throughout pregnancy and post partum.
- Extended psychosocial interventions that exceed minimal advice to quit should be made available for pregnant women.
- Consider lowest dose intermittent nicotine replacement therapy after the first trimester using a risk/benefit approach.

Pregnant and lactating women

Issues
- Cigarette smoking by pregnant women causes adverse fetal outcomes including stillbirth, spontaneous abortion, reduced fetal growth, preterm birth, low birth weight, placental abruption, sudden infant death, cleft palate, cleft lip and childhood cancers.
- Maternal smoking increases the risk of poor health outcomes in infants and children including sudden infant death syndrome, respiratory infections, asthma, and middle ear disease.
- Although abstinence early in pregnancy will produce the greatest benefits to the mother and foetus, smoking cessation at any point during the pregnancy will be beneficial.
- The health benefits of breastfeeding whilst smoking outweigh the risk of formula feeding in a smoking household. Mothers who smoke whilst breastfeeding should be encouraged and supported to stop smoking; concurrently educated about the benefits of breastfeeding and encouraged to continue breastfeeding their babies.

Mater Pathology

The Mater Pathology team provides exceptional diagnostic and consultative services for all doctors and members of the community.

Mater pathology offers a complete routine and specialised service including, Anatomical Pathology, Cytology, Biochemical Pathology, Haematology, Immunology, Microbiology, Serology, Genetic testing, Molecular Genetics, Genomics, Cytogenetics and HPV Screening. For more information on the complete range of tests please contact Mater Pathology on 07 3163 8500

Benefits of using Mater Pathology include

- All of our collection centres are staffed by qualified collectors experienced in the Collection of adult, maternity, paediatric and neonatal tests.
- Mater Pathology offers a bulked billed home collection service for all Southside residents. We will visit you in the comfort of your own home at a time that is convenient for you between 7 am and 5 pm Monday to Friday. Phone 07 3163 8500 to book your home collection.
- Mater Pathology is Queensland's leading not-for-profit pathology provider, reinvesting revenue back into health care.
- Mater Pathology has over 85 years experience and established Queensland’s first pathology laboratory in 1919.

Mater Pathology has collection centres located at: Alexandra Hills, Annerley, Beenleigh, Brookwater, Capalaba, Chermside, Cleveland, Coorparoo, Deagon, Hope Island, Inala, Ipswich, Kallangur, Kedron, Keperra, Logan Central, Macleay Island, Oxley, Russell Island, South Brisbane, Springfield, Springwood, Sunnybank Hills and Yamanto.

Mater Pathology provides 24 hour pathology collection services via: Mater Private Emergency Care Centre
301 Vulture St, South Brisbane Qld 4101.

For further information call 07 3163 8500 or visit pathology.mater.org.au

Exceptional People. Exceptional Care.
